Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to human neurotransmitter transporter polypeptides referred to as HIPHUM 000029 and nucleic acid molecules encoding such polypeptides. Sequences of the invention their agonists and antagonists are useful for preparing a medicament for treatment or prophylaxis of disorders such as psychiatric disorders, bipolar disorders, unipolar depression, anxiety, schizophrenia, psychotic disorders, neurological/enucledegenerative disorders and drug dependence. Polynucleotides of the invention are useful as primers and probes. They are also used in gene therapy. The present sequence is human HIPHUM 0000029 protein. The HIPHUM 0000029 gene is located on chromosome 1p21.

unsmitter transporter polypeptide HIPHUM 0000029, useful in treating or preventing disease such as

An isolated neurotransmitter

regulation is

anxiety or depression

The present sequence represents a human transporter polypeptide. The specification describes 20685, 579, 17114, 23821, 33894 or 32613 human transporter polypeptides. The 20685 transporter is similar to vesicular monoamine transporters. The 2579 transporter is similar to sulfate transporters.

Commonoamine transporters. The 17114 transporter is similar to ABC transporters. The 32613 transporter is similar to sulfate transporters.

Comparison terms and subsporter is similar to ABC and diagnosing neurological and central nervous system disorders (e.g. The transporters (e.g., cancer) inflammatory disorders (e.g., cancer) blood disorders, and immune and inflammatory disorders. They are also useful for treating and inflammatory disorders. Involving the spleen (e.g., Hodgkin disease, call carporders involving the spleen (e.g., Hodgkin disease, color (alganosing disorders; involving the spleen (e.g., Hodgkin disease, color (cirrhosis), uterus and endometrium (e.g., endometrial stromal tumours), brain (e.g., ischemia), T-cells (e.g., chomical syndrome), skin (lupus crythematosus), haematopoietic stem cells (e.g., Alsorders involving thymus, certicis, epididymis, prostate, thyroid (e.g., Graves disease), describ, epididymis, prostate, thyroid (e.g., Graves disease), chart, and ovary and intestine (e.g., tumour), pancreas (e.g., pancreatitis), habelet number and ovary.

The present sequence is human NTT7 protein encoded by a cDNA. NTT7 is thought to be a member of the neurotransmitter family of polypeptides. WTT7 sequences are useful for treating psychiatric disorders, anxiety, depression, schizophrenia, phobias, panic disorder, obsessive computative disorder. Parkinson's disease, central nervous system disorders, sind disorders, pain, neuropathic pain, sleep disorders, stroke, neurological disorders, pain, neuropathic pain, sleep disorders, and disorders in which neurotransmitters are implicated. NTT7 sequences are useful for screening antagonists and agonists of NTT7 sequences are for inducing immunological response in a mammal. NTT7 sequences and its, antibodies are useful to configure screening methods for detecting the ceffect of added compounds on the production of mRNA and polypeptide in cells. NTT7 is useful in conventional low capacity screening methods and also in high-throughput screening (HTS) formats and is useful for cleaning the configure expressing NTT7 or to purify NTT7 by affinity clones expressing NTT7 is to purify NTT7 by affinity clones expressing of chromosome

```

The sequence represents a novel human transporter protein of the GABA transporter subfamily. The invention relates to a novel isolated human peptide of the GABA transporter subfamily. The peptide and nucleic acids are useful in developing human therapeutics and diagnostic compositions. These are also useful in drug screening, particularly as models for the development of human therapeutic targets.

The NTT-2 polypeptide contains sodium.neurotransmitter symporter family (SNF) signature sequences. The NTT polypeptide and polynucleotide are useful for diagnosis, treatment and prevention of transport, neurological and psychiatric disorders. Transport disorders
acute stress disorder; anorexia nervosa; transgenic animal; gene therapy; sodium:neurotransmitter symporter family; SNF.

ï

creating knockin humanised animals or transgenic animals to model human disease and to detect and quantify gene expression in biopsied tissues in which expression of NTT is correlated with disease. The polynucleotide is also useful for generating hybridisation probes useful in mapping the naturally occurring genomic sequence and oligonucleotide primers derived from it are useful to detect single nucleotide polymorphisms. NTT, its fragments and antibodies are useful as elements on a microarray which is useful to monitor or measure protein-protein interactions, drug-target interactions and gene expression profiles. Sequences of the NTT polypeptide are used to analyse the proteome of a tissue or cell type. The polypeptide of the invention is also useful for screening its agonist, antagonist, modulator or a compound that binds

The invention relates to a purified human sodium-dependent

neurotransmitter transporter polypeptide comprising a sequence of 259

amino acids, given in the specification. A nucleic acid encoding the

protein is useful for detecting a polynucleotide encoding the protein in

protein cancelled acid material of a biological sample by hybridisation

a biological sample by hybridisation complex. The protein of the

complex, and detecting the hybridisation complex. The protein of the

invention and its encoding gene are useful for screening for agents which

decrease the activity of sodium-dependent neurotransmitter transporter

polypeptide by contacting the test compound with the protein or its gene

and detecting binding of the test compound to the protein or its gene. A

vector comprising the polynucleotide of the invention or a reagent that

modulates the activity of the protein or its gene. A

preparation of a medicament for modulating the activity of sodium
compensation of a medicament for modulating the activity of sodium
compensation of a sectival as central or peripheral nervous system

conservation of a protein or its gene is useful for the

conservation of a medicament for modulating the activity of sodium
conservation of a medicament for modulating the activity of sodium
conservation of a medicament for modulating the activity of sodium
conservation of a medicament for modulating the activity of sodium
conservation of a medicament for modulating the activity of sodium
conservation of a medicament for modulating the activity of sodiumin to brain injuries, cerebrovascular diseases and their consequences, Parkinson's disease, corticobasal degeneration, motor neuron disease, dementia, including multiple sclerosis, traumatic brain injury, small-vessel cerebrovascular disease, and Alzheimer's disease. The polynucleotide of the invention can be used in gene therapy. This sequence represents the protein sequence identified by SwissProt Accession No: Q08469 relating to the sodium-dependent neurotransmitter transporter protein of the invention.

The invention relates to invertebrate symporter cell surface receptors of the sodium/neurotransmitter family (SNF) and nucleic acid molecules encoding such receptors. The SNF protein is useful for detecting a candidate compound especially a putative pesticidal or pharmaceutical agent that interacts with an invertebrate symporter cell surface receptor protein or its fragment. Insect or worm genetically modified to express protein of the invention is useful for studying invertebrate symporter cell surface receptor protein activity, by detecting the phenotype caused by the expression or mis-expression of the protein in the animal. Nucleic acids encoding the invertebrate receptor protein in their fragments are useful as biopesticides. SNF nucleic acids are useful as biopesticides. SNF nucleic acids are useful as pasticide or drug targets. The genetically mutant phenotypes in an animal model or living proteins which are useful as pesticide or drug targets. The genetically modified organisms or cells are useful in screening assays to identify pesticides or therapeutic agents, diagnostics and prognostics useful in treatment of disorders associated with ion channels. The nucleic acid molecules are also useful as hybridisation probes. The present sequence is Drosophila melanogaster (dm) NTT4 SNF homologue which is referred as dmNTT4.
                                                                                                                                                                                                                                                                                        nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  (ABB57737-ABB72072). The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signalling and cell-cell interactions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and insectioides, theractions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30311), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins

                                                                                                                                                                                                                                                                                                LALEEPVDYKQSVLNVAGEAGGKQKAVEEELDAEDRPAWNSKLQYILAQIGFSVGLGNIW 84
                                                                                                        The invention provides a cDNA sequence encoding a new human nerve mass-transferring protein. The invention also relates to the application of the polynucleotide and the polypeptide, and the method of producing the polynucleotide and the polypeptide. The present sequence is the protein of the invention.

This sequence is the human neurotransmitter HPDDV78 polypeptide of the invention. HPDDV78 polypeptides and polynucleotides are useful for dispansed susceptibility to diseases by detection mutations in the HPDDV78 gene using probes containing the HPDDV78 nucleotide sequence, and diagnose diseases associated with HPDDV78 imbalance by determining HPDDV78 polypeptide expression levels. HPDDV78 polypeptides can be used to screen for agonists and antagonists which bind HPDDV78 by observing the binding, or stimulation or inhibition of HPDDV78 activity. These can be used in treatment to activate (agonist) and infinitation of antisense sequences to prevent expression, or HPDDV78 polypeptides to treat conditions associated with a lack of HPDDV78
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   polypeptide production. HPDDV78 antibodies are useful for inducing an immune response to immunise and prevent diseases, and for isolating chromatography. HPDDV78 clones or purifying the polypeptide by affinity chromatography. HPDDV78 polypeptides can be administered directly or as a vaccine to inoculate against disease. Diseases diagnosed, prevented or treated include: brain hypoxia, trauma, seizure and stroke. The HPDDV78 polypeptide is also useful for mapping the gene to a chromosome, allowing gene inheritance to be studied through linkage analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 280
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          103 LVLLIIIGIPLFFLELAVGQRIRRGSIGVWHYICPRLGGIGFSSCIVCLFVGLYYNVIIG 162

NrT, its fragments and antibodies are useful as elements on a microarray which is useful to monitor or measure protein-protein interactions, drug-target interactions and gene expression profiles. Sequences of the NrT polypeptide are used to analyse the protecome of a tissue or cell type. The polypeptide of the invention is also useful for screening its agonist, antagonist, modulator or a compound that binds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (Incyte ID No: 747553CD1). The NTT-6 polypeptide contains sodium.neurotransmitter symporter family (SNF) signature squences. The NTT polypeptide and polymucleotide are useful for diagnosis, teatment and prevention of transport, neurological and psychiatric disorders. Transport disorders include akinesia, amyotrophic lateral sclerosis, ataxia telangiectasia, cystic fibrosis, Becker's muscular dystrophy, diabetes mellitus, diabetes insipidus, myasthenia gravis, myostroliis, Parkinson's disease, prostate cancer; cardiac disorders associated with transport
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        60 RPAWNSKLQYILAQIGFSVGLGNIWRFPYLCQKNGGGAYLVPYLVLLIIIGIPLFFLELA 119

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL01840-ABL16175) and the encoded proteins

Claim 1; Columns 23-28; 30pp; English.

The present sequence is the rat brain derived orphan transporter, 1212, which may be used to identify cpds. Which specifically interact with and bind to it, for the development of therapeutic gents for neurological and psychiatric disorders. The drugs can be used to alleviate abnormalities resulting from the over or under expression of the transporter, and to treat conditions such as migraine headaches, and brain swelling after injury, hypoxia, or seizures and stroke. The ralla encoding CDNA can be used to produce the transporter, or oligonucleotide compans. for the detection or therapy of ralla related disease, or to produce transgenic animals. The transporter protein can also be used to produce antibodies for ralla detection and inhibition. The ralla cDNA was obtd. by, screening a rat brain cDNA library with probes based on rat GABA.
